Outline

- 1 Motivation – the analogy with color
 - The analogy with color, $su(N)$
 - Lorentz structure, two copies of $su(2)$
- 2 Building the flow picture
- 3 QED examples (massless)
- 4 QCD helicity flow (massless)
 - Non-abelian vertices in flow picture
 - QCD helicity-flow example
- 5 Conclusion and outlook

Motivation – the analogy with color

In QCD we translate color structures to flows of color

- SU(N) Fierz identity: remove adjoint indices ($T_R = 1$)

$$\underbrace{\begin{array}{ccc} a & & c \\ \hline & \text{g} & \\ \hline b & & d \end{array}}_{t_{ac}^g t_{bd}^g} = \underbrace{\begin{array}{ccc} a & & c \\ \diagdown & & / \\ & & \\ / & & \diagdown \\ b & & d \end{array}}_{\delta_{ad} \delta_{bd}} - \frac{1}{N} \underbrace{\begin{array}{ccc} a & & c \\ \hline & & \\ \hline b & & d \end{array}}_{\delta_{ac} \delta_{bd}}$$

- Remove gluon vertices similarly

$$i f^{abc} = \begin{array}{c} b \\ \text{---} \\ \bullet \\ \text{---} \\ a \quad c \end{array} = \begin{array}{c} b \\ \text{---} \\ \circ \\ \text{---} \\ a \quad c \end{array} - \begin{array}{c} b \\ \text{---} \\ \circ \\ \text{---} \\ a \quad c \end{array}$$

In the end every amplitude is a linear combination of products of δ s

Can we do something similar for spacetime?

- At the algebra level, the Lorentz group consists of two copies of $su(2)$
 $so(3, 1) \cong su(2) \oplus su(2)$
- The Dirac spinor structure transforms under the direct sum representation $(\frac{1}{2}, 0) \oplus (0, \frac{1}{2})$, in the chiral/Weyl basis

$$u(p) \rightarrow \begin{pmatrix} e^{i\theta\frac{\bar{\sigma}}{2} + \eta\frac{\bar{\sigma}}{2}} & 0 \\ 0 & e^{i\theta\frac{\bar{\sigma}}{2} - \eta\frac{\bar{\sigma}}{2}} \end{pmatrix} u(p)$$

i.e. actually two copies of $SL(2, \mathbb{C})$, generated by the complexified $su(2)$ algebra, projected onto by $P_{\pm} = \frac{1}{2}(1 \pm \gamma^5)$, $\gamma^5 = \begin{pmatrix} -1 & 0 \\ 0 & 1 \end{pmatrix}$

- For $m = 0$

$$u(p) = \begin{pmatrix} u_{-}(p) \\ u_{+}(p) \end{pmatrix} = \begin{pmatrix} \tilde{\lambda}_{p,\alpha}^{\dot{\alpha}} \\ \lambda_{p,\alpha} \end{pmatrix}, \quad \bar{u}(p) = (\tilde{\lambda}_{p,\dot{\alpha}} \quad \lambda_{p,\alpha}),$$

$$v(p) = \begin{pmatrix} v_{+}(p) \\ v_{-}(p) \end{pmatrix} = \begin{pmatrix} \tilde{\lambda}_{p,\dot{\alpha}} \\ \lambda_{p,\alpha} \end{pmatrix}, \quad \bar{v}(p) = (\tilde{\lambda}_{p,\dot{\alpha}} \quad \lambda_{p,\alpha})$$

Can we do something similar for spacetime?

- Lorentz inner products formed using the only $SL(2, \mathbb{C})$ invariant object $\epsilon^{\alpha\beta}$, $\epsilon^{12} = -\epsilon^{21} = \epsilon_{21} = -\epsilon_{12}$

$$\underbrace{\epsilon^{\alpha\beta} \lambda_{i,\beta}}_{\equiv \lambda_i^\alpha} \lambda_{j,\alpha} = \lambda_i^\alpha \lambda_{j,\alpha} = \langle ij \rangle, \quad \underbrace{\epsilon_{\dot{\alpha}\dot{\beta}} \tilde{\lambda}_i^{\dot{\beta}}}_{\equiv \tilde{\lambda}_{i,\dot{\alpha}}} \tilde{\lambda}_j^{\dot{\alpha}} = \tilde{\lambda}_{i,\dot{\alpha}} \tilde{\lambda}_j^{\dot{\alpha}} = [ij], \quad \langle ij \rangle, [ij] \sim \sqrt{s_{ij}}$$

Note: antisymmetric $\langle ij \rangle = -\langle ji \rangle$, $[ij] = -[ji]$

- The Dirac Lagrangian $\bar{\psi}(i\partial_\mu \gamma^\mu - m)\psi$ gives after requiring local gauge invariance couplings $\sim A_\mu \bar{u}(p_1)\gamma^\mu u(p_2)$, i.e., the photon couples to

$$\bar{u}(p_1)\gamma^\mu u(p_2) = \underbrace{(\tilde{\lambda}_{1,\dot{\alpha}} \lambda_1^\alpha)}_{\bar{u}(p_1)} \underbrace{\begin{pmatrix} 0 & \sqrt{2}\tau^{\mu,\dot{\alpha}\beta} \\ \sqrt{2}\bar{\tau}^{\mu}_{\alpha\dot{\beta}} & 0 \end{pmatrix}}_{\gamma^\mu} \underbrace{\begin{pmatrix} \tilde{\lambda}_2^{\dot{\beta}} \\ \lambda_{2,\beta} \end{pmatrix}}_{u(p_2)}$$

where $\sqrt{2}\tau^\mu = (1, \vec{\sigma})$, $\sqrt{2}\bar{\tau}^\mu = (1, -\vec{\sigma})$, $\text{Tr}(\tau^\mu \bar{\tau}^\nu) = g^{\mu\nu}$

- giving vertices $\sim \tilde{\lambda}_{1,\dot{\alpha}} \tau^{\mu,\dot{\alpha}\beta} \lambda_{2,\beta}$ and $\lambda_1^\alpha \bar{\tau}^{\mu}_{\alpha\dot{\beta}} \tilde{\lambda}_2^{\dot{\beta}}$

Can we do something similar for spacetime?

- Lorentz four-vectors transform under a direct product representation $\sim (\frac{1}{2}, \frac{1}{2})$ and are mapped to

$$p^{\dot{\alpha}\beta} \equiv p_{\mu} \tau^{\mu, \dot{\alpha}\beta} = \frac{1}{\sqrt{2}} p_{\mu} \sigma^{\mu, \dot{\alpha}\beta} = \frac{1}{\sqrt{2}} \begin{pmatrix} p_0 + p_3 & p_1 - ip_2 \\ p_1 + ip_2 & p_0 - p_3 \end{pmatrix},$$

$$\bar{p}_{\alpha\dot{\beta}} \equiv p_{\mu} \bar{\tau}^{\mu}_{\alpha\dot{\beta}} = \frac{1}{\sqrt{2}} p_{\mu} \bar{\sigma}^{\mu}_{\alpha\dot{\beta}} = \frac{1}{\sqrt{2}} \begin{pmatrix} p_0 - p_3 & -p_1 + ip_2 \\ -p_1 - ip_2 & p_0 + p_3 \end{pmatrix},$$

It can be proved that transforming (only) the spinor indices in $\tau^{\mu, \dot{\alpha}\beta}$ or $\bar{\tau}^{\mu}_{\alpha\dot{\beta}}$, using the direct product transformation gives the Lorentz four-vector transformation. It can also be read off from the Lagrangian that this must be the case.

- For lightlike momenta $p^2 = 0$

$$p^2 = 0 \Leftrightarrow \det[p^{\dot{\alpha}\beta}] = 0 \underbrace{\longrightarrow}_{\text{Dirac}} \not{p} \equiv \sqrt{2} p^{\dot{\alpha}\beta} = \tilde{\lambda}_{\dot{\alpha}}^{\beta} \lambda_{\beta}^{\dot{\alpha}}$$

Can we do something similar for spacetime?

- Similarly $\bar{p} = \sqrt{2} p_\mu \bar{\tau}_{\alpha\dot{\beta}}^\mu \stackrel{p^2=0}{=} \lambda_{p,\alpha} \tilde{\lambda}_{p,\dot{\beta}}$
- Multiplying this with $\tau^{\nu,\dot{\beta}\alpha}$, summing over indices, and using $\text{Tr}(\tau^\mu \bar{\tau}^\nu) = g^{\mu\nu}$ we get

$$\underbrace{\sqrt{2} p_\mu \bar{\tau}_{\alpha\dot{\beta}}^\mu}_{\lambda_{p,\alpha} \tilde{\lambda}_{p,\dot{\beta}}} \tau^{\nu,\dot{\beta}\alpha} = \sqrt{2} p_\mu g^{\mu\nu} = \sqrt{2} p^\nu \implies p^\nu \stackrel{p^2=0}{=} \frac{1}{\sqrt{2}} \tilde{\lambda}_{p,\dot{\beta}} \tau^{\nu,\dot{\beta}\alpha} \lambda_{p,\alpha}$$

- Note: A lightlike four-vector same spinor structure as vertex \sim **pseudo vertex**
- Need polarization vectors for external photons

$$\varepsilon_+^\mu(p, r) = \frac{\tilde{\lambda}_{p,\dot{\alpha}} \tau^{\mu,\dot{\alpha}\beta} \lambda_{r,\beta}}{\langle rp \rangle}, \quad \varepsilon_-^\mu(p, r) = \frac{\lambda_p^\alpha \bar{\tau}_{\alpha\dot{\beta}}^\mu \tilde{\lambda}_r^{\dot{\beta}}}{[pr]}$$

- Note: Also same spinor structure as vertex \sim **pseudo vertex**

Building the flow picture

Let's compare to QCD color

- Color single $su(N)$
- Quarks in fundamental rep.
- Gluons in adjoint rep \rightarrow combination of fundamental rep. indices
- $t_{ij}^a t_{kl}^a \rightarrow \delta_{il} \delta_{jk} - \frac{1}{N} \delta_{ij} \delta_{kl}$
SU(3) generators
- Lorentz structure $su(2)$, $su(2)$
- Spinors in different irreps. $\lambda, \tilde{\lambda}$
- Four-vectors in direct product rep \rightarrow combination of spinor reps
- $\tau^{\mu, \dot{\alpha}\beta} \bar{\tau}_{\mu, \gamma\dot{\delta}} \rightarrow \delta_{\dot{\delta}}^{\dot{\alpha}} \delta_{\gamma}^{\beta}$
not exactly $su(2)$ generators...

Creating a helicity flow picture

- Recall the QCD Fierz identity ($T_R = 1$)

The diagram illustrates the QCD Fierz identity. On the left, a four-point vertex with external lines a and c at the top, and b and d at the bottom. A wavy gluon line connects a to b and c to d . This is labeled $t_{ac}^g t_{bd}^g$. This is equal to the sum of two diagrams: one where a and b cross, and another where c and d cross, labeled $\delta_{ad} \delta_{bd}$. This is then equal to $-\frac{1}{N}$ times a diagram where a and b are connected by a horizontal line, and c and d are connected by a horizontal line, labeled $\delta_{ac} \delta_{bd}$.

- Spinor Fierz in flow form is (always read indices along arrow):

The diagram illustrates the spinor Fierz identity in flow form. On the left, a four-point vertex with external lines α and β at the top, and η and $\dot{\gamma}$ at the bottom. A wavy line connects α to η and β to $\dot{\gamma}$. This is labeled $\bar{\tau}_{\alpha\dot{\beta}}^\mu \tau_{\dot{\gamma}\eta}^\mu$. This is equal to a diagram where α and η are connected by a vertical line, and β and $\dot{\gamma}$ are connected by a vertical line, labeled $\delta_{\alpha\eta} \delta_{\dot{\gamma}\dot{\beta}}$.

- No $1/N$ -suppressed term even **better than QCD!**

Photon exchange

- Above we had a “flow”, coming from photon exchange, applicable for $\bar{\tau}_{\alpha\dot{\beta}}^{\mu} \tau_{\dot{\mu}\gamma\dot{\eta}}$, but photon exchange may also give two τ or two $\bar{\tau}$
- $\bar{\tau}_{\alpha\dot{\beta}}^{\mu} \bar{\tau}_{\dot{\mu},\gamma\dot{\eta}} = \varepsilon_{\dot{\beta}\dot{\eta}} \varepsilon_{\alpha\gamma}$ does **not** create a flow!
- Pictorially, problem seen by arrows pointing towards or away from each other

Photon exchange: The arrow flip

- Can fix with charge conjugation of a current

$$\bullet \lambda_i^\alpha \bar{\tau}_{\alpha\dot{\beta}}^\mu \tilde{\lambda}_j^{\dot{\beta}} = \tilde{\lambda}_{j,\dot{\alpha}} \tau^{\mu,\dot{\alpha}\beta} \lambda_{i,\beta}$$

- Or in pictures, an arrow flip:

$$\bullet \mu \text{ wavy line } \begin{array}{l} \text{---} j \\ \text{---} i \end{array} = \mu \text{ wavy line } \begin{array}{l} \text{---} j \\ \text{---} i \end{array}$$

- Can replace $\tau \leftrightarrow \bar{\tau}$ if also replace the spinors
- Considering the complete diagram we have:

$$\underbrace{\begin{array}{c} 1 \text{---} \text{---} 2 \\ \text{wavy line} \\ 4 \text{---} \text{---} 3 \end{array}}_{(\lambda_1^\alpha \bar{\tau}_{\alpha\dot{\beta}}^\mu \tilde{\lambda}_2^{\dot{\beta}})(\lambda_3^\gamma \bar{\tau}_{\mu,\gamma\dot{\eta}} \tilde{\lambda}_4^{\dot{\eta}})} = \underbrace{\begin{array}{c} 1 \text{---} \text{---} 2 \\ \text{wavy line} \\ 4 \text{---} \text{---} 3 \end{array}}_{(\lambda_1^\alpha \bar{\tau}_{\alpha\dot{\beta}}^\mu \tilde{\lambda}_2^{\dot{\beta}})(\lambda_{4,\dot{\eta}} \tau_{\mu}^{\dot{\eta}\gamma} \tilde{\lambda}_{3,\gamma})} = \underbrace{\begin{array}{c} 1 \text{---} \text{---} 2 \\ \text{wavy line} \\ 4 \text{---} \text{---} 3 \end{array}}_{\lambda_1^\alpha \lambda_{3,\alpha} \tilde{\lambda}_{4,\dot{\beta}} \tilde{\lambda}_2^{\dot{\beta}} \equiv \langle 13 \rangle [42]}$$

Creating a helicity flow picture

- Here we have used

- $\lambda_i^\alpha \lambda_{j,\alpha} = \langle ij \rangle = i \longrightarrow j$
- $\tilde{\lambda}_{i,\beta} \tilde{\lambda}_j^{\dot{\beta}} = [ij] = i \dashrightarrow j$

- and before we had

- $\delta_\alpha^\beta = \alpha \longrightarrow \beta$
- $\delta_{\dot{\alpha}}^{\dot{\beta}} = \dot{\beta} \dashrightarrow \dot{\alpha}$

analogous to QCD $\delta_{ij} = i \longrightarrow j$ (color delta function)

- In general we let

- $\lambda_{j,\alpha} = \text{grey circle} \longrightarrow j$, $\lambda_i^\alpha = \text{grey circle} \longleftarrow i$
- $\tilde{\lambda}_{i,\dot{\alpha}} = \text{grey circle} \dashleftarrow i$, $\tilde{\lambda}_j^{\dot{\alpha}} = \text{grey circle} \dashrightarrow j$

Creating a helicity flow picture: external photons

- We also need external photons

$$\bullet \quad \varepsilon_+^\mu(p, r) = \frac{\tilde{\lambda}_{p,\dot{\alpha}} \tau^{\mu,\dot{\alpha}\beta} \lambda_{r,\beta}}{\langle rp \rangle}, \quad \varepsilon_-^\mu(p, r) = \frac{\lambda_p^\alpha \bar{\tau}^{\mu}_{\alpha\dot{\beta}} \tilde{\lambda}_r^{\dot{\beta}}}{[pr]}$$

- External photons are just $f\bar{f}\gamma$ vertices with a denominator
- So we can Fierz (with possible arrow swap) any external photon

$$\bullet \quad \varepsilon_+^\mu(p, r) \rightarrow \frac{1}{\langle ri \rangle} \text{ (circle)} \begin{array}{c} \text{---} \leftarrow \text{---} \\ \text{---} \rightarrow \text{---} \end{array} \begin{array}{c} p \\ r \end{array}, \quad \text{or} \quad \varepsilon_+^\mu(p, r) \rightarrow \frac{1}{\langle ri \rangle} \text{ (circle)} \begin{array}{c} \text{---} \rightarrow \text{---} \\ \text{---} \leftarrow \text{---} \end{array} \begin{array}{c} p \\ r \end{array}$$

$$\bullet \quad \varepsilon_-^\mu(p, r) \rightarrow -\frac{1}{[ri]} \text{ (circle)} \begin{array}{c} \text{---} \rightarrow \text{---} \\ \text{---} \leftarrow \text{---} \end{array} \begin{array}{c} r \\ p \end{array}, \quad \text{or} \quad \varepsilon_-^\mu(p, r) \rightarrow -\frac{1}{[ri]} \text{ (circle)} \begin{array}{c} \text{---} \leftarrow \text{---} \\ \text{---} \rightarrow \text{---} \end{array} \begin{array}{c} r \\ p \end{array}$$

Creating a helicity flow for QED: fermion propagators

- So far: vertices, internal and external photons, external fermions
- Missing QED piece: Fermion propagators, containing \not{p}
- We split $\not{p}_{4 \times 4} \equiv p_\mu \gamma^\mu$ split into two terms

$$\bullet \not{p} = \sqrt{2} p^\mu \tau_{\mu}^{\dot{\alpha}\beta} \stackrel{p^2=0}{=} \tilde{\lambda}_{\dot{\alpha}}^{\beta} \lambda_{\beta}^{\dot{\alpha}} = \begin{array}{c} p \\ \dashrightarrow \dot{\alpha} \quad \beta \end{array} \equiv \begin{array}{c} \dot{\alpha} \quad p \quad \beta \\ \dashrightarrow \bullet \rightarrow \end{array}$$

$$\bullet \bar{\not{p}} = \sqrt{2} p_\mu \bar{\tau}^{\mu}_{\dot{\alpha}\beta} \stackrel{p^2=0}{=} \lambda_{\beta, \dot{\alpha}} \tilde{\lambda}_{\dot{\alpha}, \beta} = \begin{array}{c} p \\ \alpha \quad \dot{\beta} \end{array} \equiv \begin{array}{c} \alpha \quad p \quad \dot{\beta} \\ \rightarrow \bullet \dashrightarrow \end{array}$$

- For massless tree-level propagators we have $p^\mu = \sum p_i^\mu$, $p_i^2 = 0$
- Convenient shorthand:

$$\bullet \not{p} = \begin{array}{c} \dot{\alpha} \quad p \quad \beta \\ \dashrightarrow \bullet \rightarrow \end{array} = \sum_i \tilde{\lambda}_i^{\dot{\alpha}} \lambda_i^{\beta} \text{ for } p_i^2 = 0$$

$$\bullet \bar{\not{p}} = \begin{array}{c} \alpha \quad p \quad \dot{\beta} \\ \rightarrow \bullet \dashrightarrow \end{array} = \sum_i \lambda_{i, \alpha} \tilde{\lambda}_{i, \dot{\beta}} \text{ for } p_i^2 = 0$$

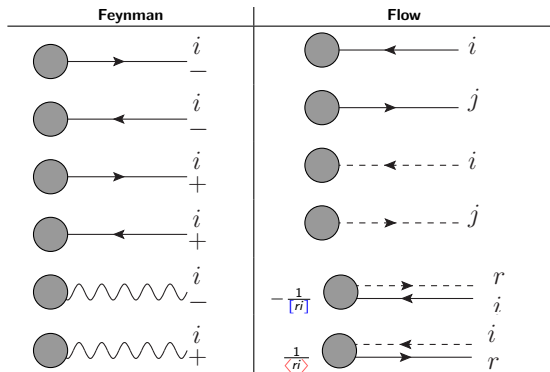

Add extra fermion lines

- What if we now exchange more than 2 pairs of fermions?
- Can we still use the flow picture?
 - Yes (at least at tree level)
 - Conjugation of a current holds for full fermion line
 - $\lambda_i \bar{\tau}^{\mu_1} \tau^{\mu_2} \dots \bar{\tau}^{\mu_{2n+1}} \tilde{\lambda}_j = \tilde{\lambda}_j \tau^{\mu_{2n+1}} \bar{\tau}^{\mu_{2n}} \dots \tau^{\mu_1} \lambda_i$
- Pictorially:

$$\begin{aligned}
 \lambda_i \bar{\tau}^{\mu_1} \tau^{\mu_2} \dots \bar{\tau}^{\mu_{2n+1}} \tilde{\lambda}_j &= \begin{array}{c} i \longrightarrow \bar{\tau}^{\mu_1} \quad \tau^{\mu_2} \quad \bar{\tau}^{\mu_3} \quad \dots \quad \tau^{\mu_{2n}} \quad \bar{\tau}^{\mu_{2n+1}} \longrightarrow j \\ \text{wavy lines} \end{array} \\
 &= \begin{array}{c} i \longleftarrow \tau^{\mu_1} \quad \bar{\tau}^{\mu_2} \quad \tau^{\mu_3} \quad \dots \quad \bar{\tau}^{\mu_{2n}} \quad \tau^{\mu_{2n+1}} \longleftarrow j \\ \text{wavy lines} \end{array} = \tilde{\lambda}_j \tau^{\mu_{2n+1}} \bar{\tau}^{\mu_{2n}} \dots \tau^{\mu_1} \lambda_i
 \end{aligned}$$

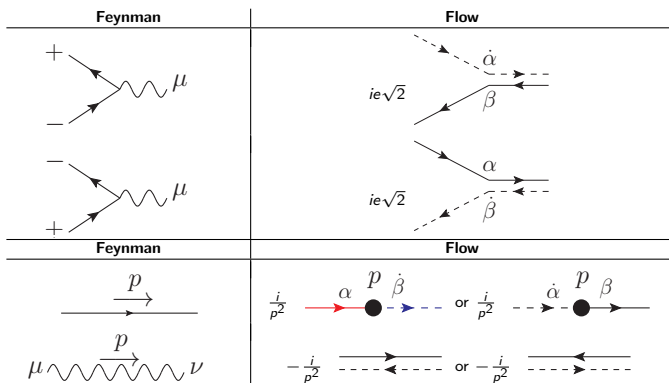

- i.e. arrow swap (and Fierz) works for any fermion line!

The QED flow rules: external particles

Everything already Fierz'd, in terms of spinors

The QED flow rules: vertices and propagators

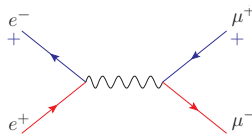

Everything already Fierz'd, in terms of spinors

QED examples (massless)

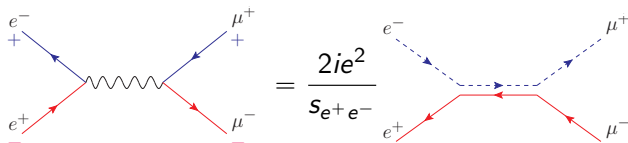

Simplest QED example, all particles outgoing

- Regular spinor-helicity \equiv easy

$$\begin{aligned}
 &= \frac{2ie^2}{s_{e^+e^-}} (\tilde{\lambda}_{e^-, \dot{\alpha}} \tau_{\mu}^{\dot{\alpha}\beta} \lambda_{e^+, \beta}) (\lambda_{\mu^-, \alpha} \bar{\tau}^{\mu}_{\alpha\dot{\beta}} \tilde{\lambda}_{\mu^+, \dot{\beta}}) \\
 &= \frac{2ie^2}{s_{e^+e^-}} \tilde{\lambda}_{e^-, \dot{\alpha}} \tilde{\lambda}_{\mu^+, \dot{\alpha}} \lambda_{\mu^-, \beta} \lambda_{e^+, \beta} \equiv \frac{2ie^2}{s_{e^+e^-}} [e^- \mu^+] \langle \mu^- e^+ \rangle
 \end{aligned}$$

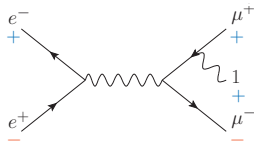

- Helicity flow \equiv super easy and intuitive

$$\begin{aligned}
 &= \frac{2ie^2}{s_{e^+e^-}}
 \end{aligned}$$

Next simplest QED example

- Regular spinor-helicity \equiv easy

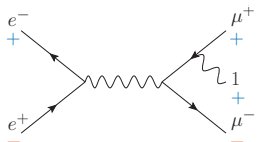

$$\begin{aligned}
 &= \frac{-i2\sqrt{2}e^3}{s_{e^+e^-}s_{\mu^+\mu^-}} \left(\tilde{\lambda}_{e^-, \dot{\alpha}} \tau_{\mu}^{\dot{\alpha}\beta} \lambda_{e^+, \beta} \right) \left(\lambda_{\mu^-, \bar{\tau}}^{\alpha} \bar{\tau}_{\alpha\dot{\beta}}^{\mu} \underbrace{(\not{p}_1 + \not{p}_{\mu^+})^{\dot{\beta}\eta}}_{\not{p}_i = \tilde{\lambda}_i^{\dot{\beta}} \lambda_i^{\eta}} \underbrace{\not{\epsilon}_{\eta\dot{\gamma}}^+(1, r)}_{\frac{\lambda_{r, \eta} \tilde{\lambda}_{1, \dot{\gamma}}}{\langle r1 \rangle}} \tilde{\lambda}_{\mu^+}^{\dot{\gamma}} \right) \\
 &= \frac{-i2\sqrt{2}e^3}{s_{e^+e^-}s_{\mu^+\mu^-} \langle r1 \rangle} \left(\tilde{\lambda}_{e^-, \dot{\alpha}} \tau_{\mu}^{\dot{\alpha}\beta} \lambda_{e^+, \beta} \right) \tilde{\lambda}_{1, \dot{\gamma}} \tilde{\lambda}_{\mu^+}^{\dot{\gamma}} \\
 &\quad \times \left(\lambda_{\mu^-, \bar{\tau}}^{\alpha} \bar{\tau}_{\alpha\dot{\beta}}^{\mu} \tilde{\lambda}_1^{\dot{\beta}} \lambda_1^{\eta} \lambda_{r, \eta} + \lambda_{\mu^-, \bar{\tau}}^{\alpha} \bar{\tau}_{\alpha\dot{\beta}}^{\mu} \tilde{\lambda}_{\mu^+}^{\dot{\beta}} \lambda_{\mu^+}^{\eta} \lambda_{r, \eta} \right) \\
 &\sim \left(\tilde{\lambda}_{e^-, \dot{\alpha}} \tilde{\lambda}_1^{\dot{\alpha}} \lambda_1^{\eta} \lambda_{r, \eta} + \tilde{\lambda}_{e^-, \dot{\alpha}} \tilde{\lambda}_{\mu^+}^{\dot{\alpha}} \lambda_{\mu^+}^{\eta} \lambda_{r, \eta} \right) \tilde{\lambda}_{1, \dot{\gamma}} \tilde{\lambda}_{\mu^+}^{\dot{\gamma}} \lambda_{\mu^-, \beta}^{\beta} \lambda_{e^+, \beta}
 \end{aligned}$$

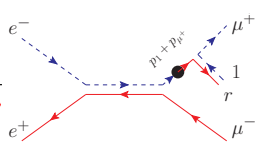

Correct Answer

$$\frac{-i2\sqrt{2}e^3}{s_{e^+e^-}s_{\mu^+\mu^-} \langle r1 \rangle} \left([e^- 1] \langle 1r \rangle + [e^- \mu^+] \langle \mu^+ r \rangle \right) [1\mu^+] \langle \mu^- e^+ \rangle$$

Next simplest QED Example

- Helicity flow \equiv super easy and intuitive

$$= \frac{-i2\sqrt{2}e^3}{s_{e^+e^-} s_{\mu^+\mu^-}} \langle r1 \rangle$$

- Immediately read off inner products

Correct Answer

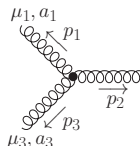

$$\frac{-i2\sqrt{2}e^3}{s_{e^+e^-} s_{\mu^+\mu^-}} \left([e^-1] \langle 1r \rangle + [e^- \mu^+] \langle \mu^+ r \rangle \right) [1\mu^+] \langle \mu^- e^+ \rangle$$

QCD helicity flow (massless)

Extending to QCD: What's different?

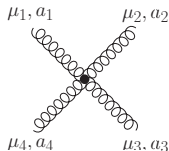

- Color is added – can be stripped away so no problem
- Non-abelian vertices:

- 3-gluon:

$$= -\frac{g_s f^{abc}}{\sqrt{2}} g^{\mu_1 \mu_2} (p_1 - p_2)^{\mu_3} + \text{cyclic}$$

- 4-gluon:

$$= ig_s^2 \sum_{Z(2,3,4)} f^{a_1 a_2 b} f^{b a_4 a_3} (g^{\mu_1 \mu_4} g^{\mu_2 \mu_3} - g^{\mu_1 \mu_3} g^{\mu_2 \mu_4})$$

Momentum: The last piece of the flow puzzle

- Recall $p^\mu = \frac{1}{\sqrt{2}} \lambda_p^\alpha \bar{\tau}_\alpha^\mu \tilde{\lambda}_p^\beta = \frac{1}{\sqrt{2}} \tilde{\lambda}_{p,\dot{\alpha}} \tau^{\mu\dot{\alpha}\beta} \lambda_{p,\beta}$

- \Rightarrow we can see p^μ as a pseudo-vertex!

- \Rightarrow we can use it as a helicity flow!

- What does p^μ get contracted with?

- $\tau_\mu \rightarrow \not{p}/\sqrt{2} = \frac{1}{\sqrt{2}} \begin{array}{c} \dot{\alpha} \\ \dashrightarrow \bullet \xrightarrow{\beta} \end{array} \quad , \quad \bar{\tau}_\mu \rightarrow \bar{\not{p}}/\sqrt{2} = \frac{1}{\sqrt{2}} \begin{array}{c} \dot{\alpha} \\ \dashrightarrow \bullet \xrightarrow{\beta} \end{array}$

- $k_\mu \rightarrow p \cdot k = \frac{\text{Tr}(p\bar{k})}{2} = \frac{1}{2} \begin{array}{c} \bullet \xrightarrow{p} \bullet \\ \dashleftarrow \end{array} \begin{array}{c} \bullet \xrightarrow{q} \bullet \\ \dashleftarrow \end{array}$

- To conclude, we can always write

$$p^\mu \rightarrow \begin{array}{c} \dot{\alpha} \\ \dashrightarrow \bullet \xrightarrow{\beta} \end{array} \quad , \quad \text{or} \quad p^\mu \rightarrow \begin{array}{c} \alpha \\ \dashrightarrow \bullet \xrightarrow{\beta} \end{array}$$

The non-abelian massless QCD flow vertices

QCD example: $q_1 \bar{q}_1 \rightarrow q_2 \bar{q}_2 g$

$$= \frac{ig_s^3}{2s_{q_1 \bar{q}_1} s_{q_2 \bar{q}_2}} \langle r1 \rangle \left[\begin{array}{c} \text{Diagram 1: } q_1^- \text{ and } \bar{q}_2^- \text{ meet at a vertex, with a gluon line (labeled 1) connecting to a vertex where } q_1^+ \text{ and } q_2^+ \text{ meet, and a gluon line (labeled } 2p_1 + p_r) \text{ connecting to a vertex where } q_2^+ \text{ and } \bar{q}_2^- \text{ meet.} \\ \text{Diagram 2: } q_1^- \text{ and } \bar{q}_2^- \text{ meet at a vertex, with a gluon line (labeled 1) connecting to a vertex where } q_1^+ \text{ and } q_2^+ \text{ meet, and a gluon line (labeled } -2p_1) \text{ connecting to a vertex where } q_2^+ \text{ and } \bar{q}_2^- \text{ meet.} \\ \text{Diagram 3: } q_1^- \text{ and } \bar{q}_2^- \text{ meet at a vertex, with a gluon line (labeled 1) connecting to a vertex where } q_1^+ \text{ and } q_2^+ \text{ meet, and a gluon line (labeled } 2p_1) \text{ connecting to a vertex where } q_2^+ \text{ and } \bar{q}_2^- \text{ meet.} \end{array} \right]$$

$$\left[\right] \equiv \left\{ 2[q_1 \bar{q}_2] \langle q_2 \bar{q}_1 \rangle ([1q_1] \langle q_1 r \rangle + [1\bar{q}_1] \langle 1r \rangle) - 2[q_1 1] \langle 1\bar{q}_1 \rangle \langle q_2 r \rangle [1\bar{q}_2] + 2[q_1 1] \langle r\bar{q}_1 \rangle \langle q_2 1 \rangle [1q_2] \right\}$$

Conclusion and outlook

Conclusion

- The helicity flow formalism gives a transparent and intuitive way of understanding the Lorentz inner products appearing in amplitudes
 - Spinor helicity formalism: 4×4 matrices $\gamma^\mu \rightarrow$ to 2×2 matrices σ^μ
 - Helicity flow method: 2×2 matrices $\sigma^\mu \rightarrow$ scalars
- Shorter calculation of Feynman diagrams
- In contrast, spinor-hel method:
 - Requires intermediate steps
 - Final result non-transparent/unintuitive
- Massless QED and QCD tree-level done, initial paper coming soon
- Should be useful for any generator using diagrams to avoid dealing with Lorentz algebra

Outlook

- Add masses complicates calculations, but seems doable...
- Electroweak sector *easy?*
- Loop calculations
- Applications within generators
- Amplitude-level calculations

Backup Slides

A word about reference momenta

- Reference momentum r represents a gauge choice
- Only require $r^2 = 0, r \cdot p_1 \neq 0$
- Choose r to simplify life the most
 - r can be different for each gauge-invariant sum
- analogy with QCD color-ordering

- Inner product is anti-symmetric ($\langle ii \rangle = [ii] = 0$)

- Choosing $r = \mu^- \Rightarrow$

What if $k^2 \neq 0$

For momenta with $k^2 = m^2$ we can use a decomposition. Consider an arbitrary light-like four-vector a^μ with $a^2 = 0$, $k \cdot a \neq 0$ and define

$$\alpha = \frac{m^2}{2a \cdot k}, \quad k'^\mu = k^\mu - \alpha a^\mu$$

such that

$$k^\mu = \alpha a^\mu + k'^\mu$$

with

$$k'^2 = k^2 - 2\alpha a \cdot k = m^2 + 2\frac{m^2}{2a \cdot k} a \cdot k = 0$$

So we can treat a massive spinor as a linear combination of two massless spinors
